1 General Description

The HT32F49153/HT32F49163 devices are based on the high-performance Arm® Cortex®-M4 32-bit RISC core operating at a frequency of up to 150 MHz. The Cortex®-M4 core features a Floating Point Unit (FPU) single precision supporting all Arm® single-precision data processing instructions and data types. It also implements a full set of DSP instructions and a Memory Protection Unit (MPU) that enhances application security.

The devices incorporate high-speed on-chip memories, including up to 256 Kbytes of Flash memory, 48 Kbytes of SRAM, and 20 Kbytes of boot memory that can be used as a Bootloader or as a general instruction/data memory (one-time-configurable) to achieve the maximum of 256+20 Kbytes. Any block of the embedded Flash memory can be protected by the “sLib” (security library), functioning as a security area with code-executable only. In addition, the devices include a high-level memory extension: an external memory controller (XMC).

The devices offer one 12-bit ADC, two 12-bit DACs, eight general-purpose 16-bit timers plus one general-purpose 32-bit timer, two basic timers, one advanced timer and one low-power ERTC. It also features standard and advanced communication interfaces: up to three I²Cs, three SPIs (multiplexed as I²Ss), eight USARTs, two CANs, an OTGFS, and infrared transmitter.

The devices operate in the -40 to +105 °C temperature range, from a 2.4 to 3.6 V power supply. A comprehensive set of power-saving mode allows the design of low-power application.

The devices are supplied in different package types. The entire HT32F49153/HT32F49163 series of devices are pin-to-pin, software and functionally compatible with each other, except that the configurations of peripherals are not fully identical depending on the package types.

arm CORTEX

2 Features

Arm® Cortex®-M4 with FPU

The Arm® Cortex®-M4 processor is the latest generation of Arm® processor for embedded systems. It is a 32-bit RISC high-performance processor that features exceptional code efficiency, outstanding computational performance and advanced response to interrupts. The processor supports a set of DSP instructions that enable efficient signal processing and complex algorithm execution. Its single precision FPU (Floating Point Unit) speeds up floating point calculation while avoiding saturation.

Memory

Internal Flash Memory

Up to 256 Kbytes of embedded Flash memory is available for storing programs and data. Any part of the embedded Flash memory can be protected by the sLib (security library), a security area that is code-executable only but non-readable. “sLib” is a mechanism designed to protect the intelligence of solution vendors and facilitate the second-level development by customers.

There is another 20-Kbyte boot memory in which the bootloader is stored. If it is not needed, this boot memory can be used as a general instruction / data memory (one-time-configurable) instead. It can be used to achieve the maximum of 256+20 Kbytes of Flash memory.

A User System Data block is included, which is used to configure hardware operations such as access / erase / write protection and watchdog self-enable. User System Data allows the independent configuration of Flash memory erase / write and access protection. The access protection is divided into low-level and high-level protections.

Memory Protection Unit (MPU)

The memory protection unit (MPU) is used to manage the CPU accesses to memory to prevent one task to accidentally corrupt the memory or resources used by any other active task. This memory area consists of up to 8 protected areas that can further be divided up into 8 subareas. The protection area sizes are between 32 bytes and the whole 4 gigabytes of addressable memory. The MPU is especially suited to the applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system).

SRAM

Up to 48 Kbytes of on-chip SRAM (read / write) is accessible at CPU clock speed with 0 wait state.

External Memory Controller (XMC)

The devices have embedded an external memory controller (XMC). It has three Chip Select outputs supporting the following devices: multiplexed PSRAM and NOR memory.

Main features:

- Write buffer
- Code execution from external memory of the multiplexed PSRAM / NOR

The XMC can be configured to interface with many graphic LCD controllers. It supports the Intel 8080 and Motorola 6800 modes.

Interrupts

Nested Vectored Interrupt Controller (NVIC)

The devices have embedded a nested vectored interrupt controller that is able to manage 16 priority levels and handle maskable interrupt channels plus the 16 interrupt lines of the Cortex®-M4. This hardware block provides flexible interrupt management features with minimal interrupt latency.

External Interrupts (EXINT)

The external interrupt (EXINT), which is connected directly to NVIC, consists of 25 edge-detector lines used to generate interrupt requests. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The external interrupt lines connect up to 16 GPIOs.

Power Control (PWC)

Power Supply Schemes

- $V_{DD} = 2.4 \sim 3.6$ V: power supply for GPIOs and the internal blocks such as ERTC, external 32 kHz crystal (LEXT), battery-powered register (BPR) and voltage regulator (LDO), provided externally via V_{DD} pins
- $V_{DDA} = 2.4 \sim 3.6$ V: power supply for ADC and DAC. V_{DDA} and V_{SSA} must be the same voltage potential as V_{DD} and V_{SS} , respectively, provided externally V_{DDA} via pins

Reset and Power Voltage Monitoring (POR / LVR / PVM)

The devices have an integrated power-on reset (POR) and low voltage reset (LVR) circuitry. It is always active and allows proper operation starting from 2.4 V. The devices remain in reset mode when V_{DD} goes below a specified threshold (VLVR), without the need for an external reset circuit.

The devices have embedded a power voltage monitor (PVM) that monitors the V_{DD} power supply and compares it to the V_{PVM} threshold. An interrupt is generated when V_{DD} drops below the V_{PVM} threshold or when V_{DD} rises above the V_{PVM} threshold. The PVM is enabled by software.

Voltage Regulator (LDO)

The LDO has three operating modes: normal, low-power, and power-down.

- Normal mode : used in Run / Sleep mode or in Deepsleep mode
- Low-power mode : used in Deepsleep mode
- Power-down mode : used in Standby mode. The regulator LDO output is in high impedance and the kernel circuitry is powered down, and the contents of the registers and SRAM are lost

This LDO always operates in normal mode after chip reset.

LDO output voltage is software configurable, including 1.3 V and 1.1 V in addition to default 1.2 V, so as to ensure the best trade-off between good performance and power consumption. Table 12 shows the maximum AHB and APB clock frequencies corresponding to different LDO voltages. Therefore, it is highly advised for users to follow the HT32F49153/HT32F49163 user manual to perform LDO voltage switching and system clock configuration.

Low-power Modes

The devices support three low-power modes:

- Sleep Mode

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt / event occurs.

■ Deepsleep Mode

Deepsleep mode achieves low-power consumption while keeping the contents of SRAM and registers. All clocks in the LDO power domain are stopped, disabling the PLL, the HICK clock and the HEXT crystal. The voltage regulator (LDO) can also be put in normal or low-power mode.

The devices can be woken up from Deepsleep mode by any of the EXINT line. The EXINT line source can be one of the 16 external lines, the PVM output, an ERTC alarm, wakeup, tamper, time stamp event, or OTG wakeup signal.

■ Standby Mode

The Standby mode is used to acquire the lowest power consumption. The internal LDO is switched off so that the entire LDO power domain is powered off. The PLL, the HICK clock and the HEXT crystal are also switched off. After entering Standby mode, SRAM and register contents are lost except for ERTC and BPR registers and Standby circuitry.

The devices exit Standby mode when an external reset (NRST pin), a WDT reset, a rising edge on the WKUPx pin, or an ERTC alarm / wakeup / tamper / time stamp occurs.

Note: The ERTC and the corresponding clock sources are not stopped by entering Deepsleep or Standby mode. The WDT depends on the User System Data settings.

Boot Modes

At startup, BOOT0 pin and nBOOT1 bit in the User System Data are used to select one of three boot options:

- Boot from Flash memory;
- Boot from boot memory;
- Boot from embedded SRAM.

The bootloader is stored in the boot memory. It is used to reprogram the Flash memory through USART1, USART2, USART3 or OTGFS1 (crystal-less support). The following table provides the pin configurations for bootloader.

Table 1. Pin Configurations for Bootloader

Peripherals	Packages	Pins
USART1	All packages	PA9: USART1_TX PA10: USART1_RX
USART2	100LQFP	PD5: USART2_TX PD6: USART2_RX
	Other packages	PA2: USART2_TX PA3: USART2_RX
USART3	100LQFP, 64LQFP	PC10: USART3_TX PC11: USART3_RX or PB10: USART3_TX PB11: USART3_RX
	48LQFP	PB10: USART3_TX PB11: USART3_RX
	Other packages	Not support
OTGFS1	All packages	PA11: OTGFS1_D- PA12: OTGFS1_D+

Clocks

The internal 48 MHz clock (HICK), divided by 6 (that is 8 MHz), is selected as the default CPU clock after any reset. An external 4 to 25 MHz clock (HEXT) can be selected, in which case it is monitored for failure. If a failure is detected, HEXT will be switched off and the system automatically switches back to the internal HICK. A software interrupt is generated. Similarly, the system takes the same action once HEXT fails when it is used as the source of PLL.

Several prescalers are available to allow the configuration of the AHB and the APB (APB1 and APB2) frequencies. The maximum frequency of the AHB and APB2 domains is 150 MHz, and APB1 120 MHz.

The devices have embedded an automatic clock calibration (ACC) block, which calibrates the internal 48 MHz HICK, assuring the most precise accuracy of the HICK in the full range of the operating temperatures.

General-Purpose Inputs / Outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain with or without pull-up or pull-down), as input (floating with or without pull-up or pull-down), or as multiplexed functions. Most of the GPIO pins are shared with digital or analog peripherals. All GPIOs are high current-capable.

The GPIO's configuration can be locked, if needed, in order to avoid false writing to the GPIO's registers by following a specific sequence.

Direct Memory Access Controller (DMA)

The devices feature two general-purpose DMA controllers (7-channel DMA1 and 7-channel DMA2) able to manage memory-to-memory, peripheral-to-memory, and memory-to-peripheral transfers. These DMA channels can be connected to peripherals with flexible mapping ability.

The DMA controller supports circular buffer management, removing the need for user code intervention when the controller reaches the end of the buffer.

Each channel is connected to dedicated hardware DMA requests, with support for software trigger on each channel. Configuration is made by software, and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals: SPI / I²S, I²C, all TMRs, ADC and DAC.

Timers (TMR)

The devices include an advanced timer, up to nine general-purpose timers, two basic timers and a SysTick timer.

The table below compares the features of the advanced, general-purpose and basic timers.

Table 2. Timer Feature Comparison

Type	Timer	Counter Resolution	Counter Type	Prescaler Factor	DMA Request Generation	Capture / Compare Channels	Complementary Output
Advanced	TMR1	16-bit	Up, down, up / down	Any integer between 1 and 65536	Yes	4	3
General-purpose	TMR2	16-bit or 32-bit	Up, down, up / down	Any integer between 1 and 65536	Yes	4	No
	TMR3 TMR4	16-bit	Up, down, up / down	Any integer between 1 and 65536	Yes	4	No
	TMR9 TMR12	16-bit	Up, down, up / down	Any integer between 1 and 65536	Yes	2	2
	TMR10 TMR11 TMR13 TMR14	16-bit	Up, down, up / down	Any integer between 1 and 65536	Yes	1	1
Basic	TMR6 TMR7	16-bit	Up	Any integer between 1 and 65536	Yes	No	No

Advanced Timer (TMR1)

The advanced timer (TMR1) can be seen as a three-phase PWM multiplexed on 6 channels. It has complementary PWM outputs with programmable dead-time insertion. It can also be seen as a complete general-purpose timer. The four independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes)
- One-period mode output

If configured as a standard 16-bit timer, it has the same features as those of the TMRx timer. If configured as a 16-bit PWM generator, it boasts full modulation capability (0 to 100 %).

In debug mode, the advanced timer counter can be frozen, and the PWM outputs are disabled to turn off any power switch driven by these outputs.

Many features are identical with those of the general-purpose TMRs that have the same architecture. Thus, the advanced timer can work together with the general-purpose TMR timers via the link feature for synchronization or event chaining.

General-Purpose Timers (TMR2 ~ 4 and TMR9 ~ 14)

Up to nine synchronizable general-purpose timers are available in the devices.

- TMR2, TMR3 and TMR4

The TMR2 timer is based on a 32-bit auto-reload up counter / down counter and a 16-bit prescaler. The TMR3 and TMR4 timers are based on a 16-bit auto-reload up counter / down counter and a 16-bit prescaler. They can offer up to four independent channels on the large-size packages. Each channel can be used for input capture / output compare, PWM or one-period mode outputs.

These general-purpose timers can work with the advanced timer via the link feature for synchronization or event chaining. Any of these general-purpose timers can be used to generate PWM outputs. Each timer has its individual DMA request mechanism. They are capable of handling incremental quadrature encoder signals and the digital outputs coming from 1 to 3 hall-effect sensors.

In debug mode, counters can be frozen.

■ **TMR9 and TMR12**

TMR9 and TMR12 are based on a 16-bit auto-reload up counter / down counter, a 16-bit prescaler, and two independent channels and two complementary channels for input capture / output compare, PWM, or one-period mode output. They can be synchronized with the TMR2, TMR3, and TMR4 full-featured general-purpose timers. They can also be used as simple timers. In debug mode, counters can be frozen. These timers have their separate DMA request generation.

■ **TMR10, TMR11, TMR13 and TMR14**

These timers are based on a 16-bit auto-reload up counter / down counter, a 16-bit prescaler, and one independent channel and one complementary channel for input capture / output compare, PWM, or one-period mode output. They can be synchronized with the TMR2, TMR3, and TMR4 full-featured general-purpose timers. They can also be used as simple timers. In debug mode, counters can be frozen. These timers have their separate DMA request generation.

Basic Timers (TMR6 and TMR7)

Both timers are mainly used to generate DAC trigger signals, and they could also be used as a generic 16-bit time base.

SysTick Timer

This timer is dedicated to real-time operating systems, but it could also be used as a standard down counter. Its features include:

- A 24-bit down counter
- Auto-reload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock sources (HCLK or HCLK / 8)

Watchdog (WDT)

The watchdog consists of a 12-bit down counter and an 8-bit prescaler. It is clocked by an independent internal LICK clock. As it operates independently from the main clock, it can operate in Deepsleep and Standby modes. It can be used either as a watchdog to reset the devices when an error occurs, or as a free running timer for application timeout management. It is self-enabled or not through the User System Data. The counter can be frozen in debug mode.

Window Watchdog (WWDT)

The window watchdog embeds a 7-bit down counter that can be set as free running. It can be used as a watchdog to reset the devices when an error occurs. It is clocked by the main clock and works as an early warning interrupt feature. The counter can be frozen in debug mode.

Enhanced Real-Time Clock (ERTC) and Battery Powered Registers (BPR)

The battery-powered domain includes:

- Enhanced real-time clock (ERTC)
- 20x 32-bit battery powered registers (BPRs)

The enhanced real-time clock (ERTC) is an independent BCD timer / counter. It supports the following features:

- Calendar with second, minute, hour (12 or 24 format), weekday, date, month, year, in BCD (binary-coded decimal) format.
- Support sub-seconds value in binary format.
- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month.
- Programmable alarms and periodic interrupts wakeup from Deepsleep or Standby mode.
- To compensate quartz crystal inaccuracy, ERTC can be calibrated via a 512 Hz external output.

These two alarm registers are used to generate an alarm at a specific time whereas the calendar fields can be independently masked for alarm comparison. To generate a periodic interrupt, a 16-bit programmable binary auto-reload down counter with programmable resolution is available and allows automatic wakeup and periodic alarms from every 120 μ s to every 36 hours. Other 32-bit registers also feature programmable sub-second, second, minute, hour, weekday and date.

A prescaler is used as a time base clock. It is by default configured to generate a time base of 1 second from a clock at 32.768 kHz.

The battery powered registers (BPR) are 32-bit registers used to store 80 bytes of user application data. Battery powered registers are not reset by a system or power reset, nor when the devices are woken up from the Standby mode.

Note: With regard to ERTC, LEXT and BPR-related functions, when V_{DD} power-on rate is lower than 1.3 ms/V, it is necessary for code to wait 60 ms until the V_{DD} is higher than 2.57 V before accessing battery powered domain registers. Doing so can guarantee normal access operation even if V_{DD} voltage drops below 2.57 V later.

Communication Interfaces

Serial Peripheral Interface (SPI)

There are up to three SPIs which are able to communicate at a speed of up to 32 Mbits/s in slave and master modes, in full-duplex and half-duplex modes. The frame is configurable to 8 bits or 16 bits. The hardware CRC generation / verification supports basic SD / MMC / SDHC card modes. All SPIs can be served by the DMA controller.

The SPI interface can be configured to operate in TI mode for communications in master and slave modes.

Inter-integrated Sound Interface (I²S)

Three standard I²S interfaces (multiplexed with SPI) are available, which can be operated in master or slave mode, in half-duplex mode. The prescaler can be used to generate multiple master mode frequencies. These interfaces can be configured to operate with a 16/24/32 bit resolution, as input or output channels. Audio sampling frequencies ranges from 8 kHz up to 192 kHz. When the I²S is configured in master mode, the master clock can be output at 256 times the sampling frequency.

All I²Ss can be served by the DMA controller.

In addition, any two of I²S interfaces in half-duplex mode can be combined (through hardware) to achieve full-duplex communication function, while the remaining one can still operate independently or used as a SPI.

Universal Synchronous / Asynchronous Receiver Transmitter (USART)

The devices have embedded eight universal synchronous / asynchronous receiver transmitters (USART1 ~ 8).

These eight interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode, LIN Master / Slave capability, hardware management of the CTS and RTS signals, RS485 driver enable signal, Smart Card mode (ISO7816 compliant) and SPI-like communication capability. All interfaces can be served by the DMA controllers, with TX/RX swap support.

USART1 and USART6 are able to communicate at a speed of up to 9.375 Mbit/s, while other USART interfaces can be up to 7.5 Mbit/s.

Table 3. USART Feature Comparison

USART Feature	USART1/2/3/4	USART6	USART5/7/8
Modem with hardware flow control	Yes	—	RTS only
Continuous communication using DMA	Yes	Yes	Yes
Multiprocessor communication	Yes	Yes	Yes
Synchronous mode	Yes	Yes	Yes
Smart card mode	Yes	Yes	Yes
Single-wire half-duplex communication	Yes	Yes	Yes
IrDA SIR	Yes	Yes	Yes
LIN mode	Yes	Yes	Yes
TX/RX swap	Yes	Yes	Yes
RS-485 driver enable	Yes	Yes	Yes

Inter-Integrated-Circuit Interface (I²C)

Three I²C bus interfaces can operate in multi-master and slave modes. They can support standard mode (max. 100 kHz) and fast mode (max. 400 kHz). Specifically, I²C1 and I²C2 support fast mode plus (max. 1 MHz). Some GPIOs provide ultra-high sink current of 20 mA.

They support 7-bit / 10-bit addressing mode and 7-bit dual addressing mode (as slave). A hardware CRC generation / verification is embedded.

They can be served by DMA controllers and they support SMBus 2.0 / PMBus.

Controller Area Network (CAN)

The devices offer two controller area network (CAN) interfaces, which are compliant with specifications 2.0A and 2.0B (active) with a bit rate of up to 1 Mbit/s. Each of them can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers, having three transmit mailboxes, two receive FIFOs with 3 stages, and 14 scalable filter banks. Each CAN has dedicated 256 bytes of buffer, which is not shared with any other CAN or peripherals.

To guarantee CAN transmission quality, the CAN 2.0 protocol states that its clock source must come from the HEXT-based PLL clock.

Universal Serial Bus On-The-Go Full-Speed (OTGFS)

The devices have embedded one USB OTG full-speed (12 Mb/s) device/host peripheral with integrated transceivers (PHY). It has software-configurable endpoint settings and supports suspend / resume. The OTGFS controller requires a dedicated 48 MHz clock. In host mode, this clock should be PLL clocked by HEXT crystal, and only in device mode, the 48 MHz HICK can be selected as the source of this clock directly.

OTGFS has the major features such as:

- Dedicated 1280 bytes of buffer (not shared with any other peripherals)
- 8 IN + 8 OUT endpoints (endpoint 0 included, device mode)
- 16 channels (host mode)
- SOF and OE output
- In accordance with the USB 2.0 Specification, the supported transfer speeds are:
 - Host mode: full-speed and low-speed
 - Device mode: full-speed

Infrared Transmitter (IRTMR)

The devices provide an infrared transmitter solution. The solution is based on the internal connection between TMR10, USART1, or USART2 and TMR11. TMR11 is used to provide carrier frequency, while TMR10, USART1, or USART2 provides the main signal to be sent.

To generate infrared remote control signals, TMR10 channel 1 and TMR11 channel 1 must be correctly configured to generate correct waveforms. All standard IR pulse modulation modes can be obtained by programming two timer output compare channels.

Cyclic redundancy check (CRC) Calculation Unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from a 32-bit data word using a fixed generator polynomial. Among other applications, CRC-based techniques are used to verify data transmission or storage integrity.

Analog-to-Digital Converter (ADC)

A 12-bit analog-to-digital converter (ADC) is embedded in the devices and features below:

- Configurable 12-bit, 10-bit, 8-bit, 6-bit resolution with self-calibration
- 5.33 MSPS maximum conversion rate in 12-bit resolution. Conversion time can be shortened through the reduction of resolution
- Share up to 24 external channels, including 6 fast channels
- Two internal channels dedicated to internal temperature sensor (V_{TS}), internal reference voltage (V_{INTRV})
- Channel-by-channel programmable sampling time
- 2 to 256 times hardware over-sampling, equivalent maximum 16-bit resolution
- Trigger option for both regular and preempted conversions
 - Software
 - Polarity-configurable hardware (internal timer event or GPIO input event)
- Converting modes
 - Single mode or sequential mode
 - In sequential mode, each trigger performs conversions on a selected group of channels
 - Repeated mode converts the selected channels continuously
 - Partition mode

- A voltage monitor feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds
- The ADC can be served by the DMA controllers

Temperature Sensor (V_{TS})

The temperature sensor generates a voltage V_{TS} that varies linearly with temperature. The temperature sensor is internally connected to the ADC1_IN16 input channel which is used to convert the sensor output voltage into a digital value.

The offset of this line varies from chip to chip due to process variation. The internal temperature sensor is more suited to applications that detect temperature variations instead of absolute temperatures. If accurate temperature readings are needed, an external temperature sensor part should be used.

Internal Reference Voltage (V_{INTRV})

The internal reference voltage (V_{INTRV}) provides a stable voltage source for ADC. The V_{INTRV} is internally connected to the ADC1_IN17 input channel.

Digital-to-Analog Converter (DAC)

The two 12-bit buffered DACs can be used to convert two digital signals into two analog voltage signal outputs.

This DAC has the following features:

- Two DAC converters: one for each output channel
- 8-bit or 12-bit monotonic output
- Left- or right-aligned data in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channel independent or simultaneous conversions
- DMA capability for each DAC
- External triggers for conversion
- Input voltage reference V_{REF+}

Several DAC trigger inputs are used in the devices. DAC outputs can be triggered through the timer update outputs that are also connected to different DMA channels.

Serial Wire Debug (SWD) / JTAG Debug Port

The Arm® SWJ-DP interface is embedded in the devices, and it is a combined serial wire debug port and JTAG that enables either a serial wire debug or a JTAG probe to be connected to the target. The JTAG TMS and TCK pins are shared with SWDIO and SWCLK, respectively. In addition, the SWO feature is available for asynchronous tracing in debug mode.

3 Overview

Device Information

Table 4. Features and Peripheral List

Part Number		HT32F49153		HT32F49163	
CPU frequency (MHz)		150			
Int. Flash (KB)		128		256	
SRAM (KB)		48			
Timers	Advanced	1	1	1	1
	32-bit general-purpose	1	1	1	1
	16-bit general-purpose	8	8	8	8

		11 / 17	23 / 24	11 / 17	23 / 24
	12-bit DAC	2			
XMC		—	1 ⁽¹⁾	—	1 ⁽¹⁾
GPIO		27 / 39	53 / 87	27 / 39	53 / 87
Operating temperatures		-40 to +105 °C			
Packages		32-pin QFN, 48-pin LQFP	64-pin LQFP, 100-pin LQFP	32-pin QFN, 48-pin LQFP	64-pin LQFP, 100-pin LQFP

Note: 1. For the 64-pin LQFP package, XMC only supports the 8-bit mode LCD panel.

2. Half-duplex I²S shares the same pin with SPI.

3. Two half-duplex I²S can be configured by hardware to achieve full-duplex I²S function.

4. For 48-pin packages and smaller, USART8 is not available, and USART5/6/7 can only be used as UART for no CK pinout.

5. For 64-pin packages, USART5/7/8 can only be used as UART for no CK pinout.

Figure 5. 48-pin LQFP Pin Assignment

Figure 6. 64-pin LQFP Pin Assignment

Figure 7. 100-pin LQFP Pin Assignment

The table below is the pin definition of the HT32F49153/HT32F49163. “—” represents that there is no such pinout on the related package. Unless descriptions in () under pin name, the functions during reset and after reset are the same as those of the actual pin name. Unless otherwise specified, all GPIOs are input floating during reset and after reset, by default. Pin multiplexed functions are selected through GPIOx_MUXx registers and the additional functions are directly selected/enabled through peripheral registers.

Pin Number				Pin Name (Function after Reset)	Type ⁽¹⁾	GPIO Level ⁽²⁾	Multiplexed Functions ⁽³⁾	Additional Functions
32 QFN	48 LQFP	64 LQFP	100 LQFP					
33	—	—	—	EPAD (V _{SS} / V _{SSA})	S	—	Digital ground / Analog ground	

Note: 1. I = input, O = output, S = power supply.

2. TC = standard 3.3 V GPIO, FT = general 5 V-tolerant GPIO, FTa = 5 V-tolerant GPIO with analog function, FTf = 5 V-tolerant GPIO with 20 mA sink current capability, R = bidirectional reset pin with embedded weak pull-up resistor, B = dedicated BOOT0 pin with embedded weak pull-down resistor. Of those, FTa pin has 5 V-tolerant characteristics when configured as input floating, input pull-up, or input pull-down mode. However, it cannot be 5 V-tolerant when analog mode. In this case, its input level should not be higher than V_{DD} + 0.3 V.
3. Function availability depend on the selected product part number. Any of GPIOs has EVENTOUT feature.
4. PC13, PC14, and PC15 are supplied through power switch. Since the switch only drives a limited amount of current (3 mA), the use of GPIOs PC13 to PC15 in output mode is limited not to be used as a current source (e.g. to drive an LED).
5. PA0, PA1, PC0, PC1, PC2 and PC3 represent fast ADC channel, others slow ADC channels.

5 Electrical Characteristics

Test Conditions

Minimum and Maximum Values

The minimum and maximum values are obtained in the worst conditions. Data based on characterization results, design simulation and / or technology characteristics are indicated in the table footnotes and are not tested in production. The minimum and maximum values represent the mean value plus or minus three times the standard deviation (mean $\pm 3\sigma$).

Typical Values

Typical values are based on $T_A = 25\text{ }^{\circ}\text{C}$, $V_{DD} = 3.3\text{ V}$.

Typical Curves

All typical curves are provided only as design guidelines and are not tested.

Power Supply Scheme

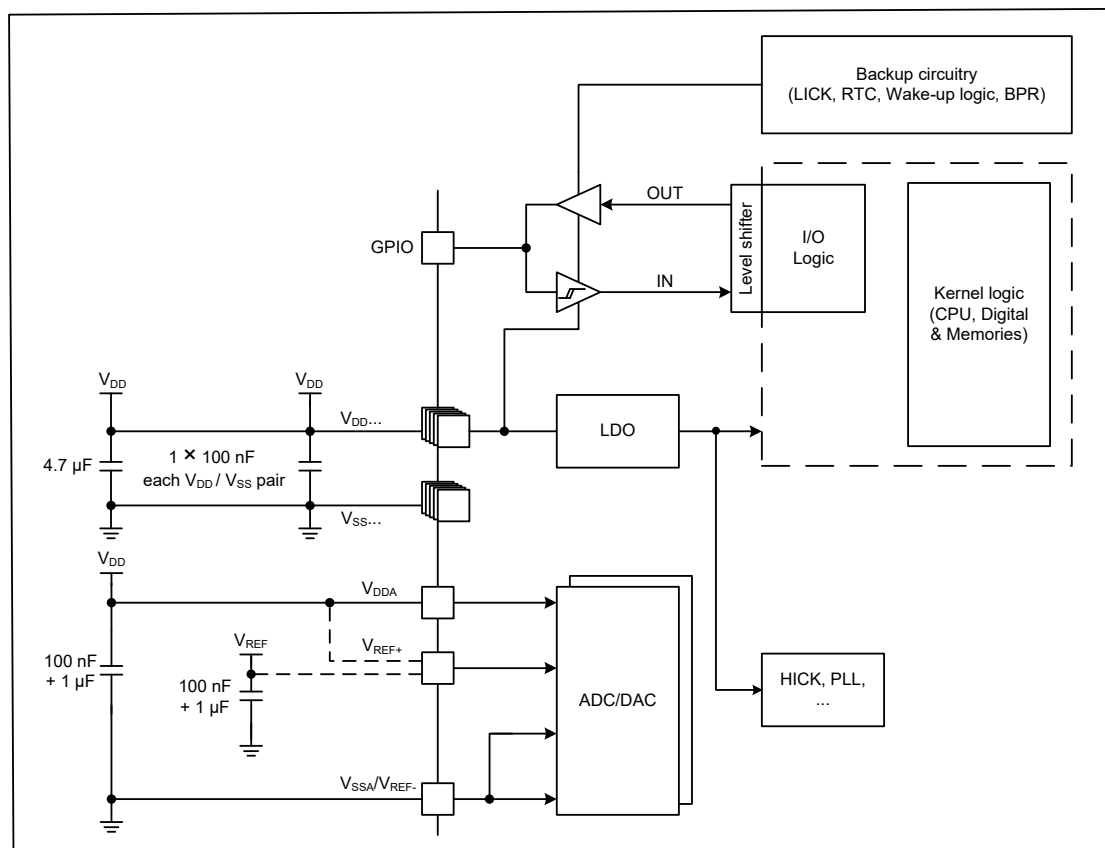

Figure 8. Power Supply Scheme

Absolute Maximum Values

Ratings

If stresses were out of the absolute maximum ratings listed in the following tables, it may cause permanent damage to the devices. These are the maximum stresses only that the devices could withstand, but the functional operation of the devices under these conditions is not implied. Exposure to maximum rating conditions for an extended period of time may affect device reliability.

Table 7. Voltage Characteristics

Symbol	Parameter	Min.	Max.	Unit
V _{DDx} - V _{SS}	External Main Supply Voltage	-0.3	4.0	V
V _{IN}	Input Voltage on FT and FTf GPIO	V _{SS} - 0.3	6.0	
	Input Voltage on FTa GPIO (Set as Input Floating, Input Pull-up, or Input Pull-down Mode)			
	Input Voltage on TC GPIO	V _{SS} - 0.3	4.0	
	Input Voltage on FTa GPIO (Set as Analog Mode)			
ΔV _{DDx}	Variations between Different V _{DD} Power Pins	—	50	mV
V _{SSx} - V _{SS}	Variations between All the Different Ground Pins	—	50	

Table 8. Current Characteristics

Symbol	Parameter	Max.	Unit
I_{VDD}	Total Current into V_{DD} Power Lines (Source)	150	mA
I_{VSS}	Total Current out of V_{SS} Ground Lines (Sink)	150	
I_{IO}	Output Current Sunk by Any GPIO and Control Pin	25	
	Output Current Source By Any GPIO And Control Pin	-25	

Table 9. Temperature Characteristics

Symbol	Parameter	Max.	Unit
T_{STG}	Storage Temperature Range	-60 ~ +150	°C
T_J	Maximum Junction Temperature	125	

Electrical Sensitivity

Based on three different tests (HBM, CDM, and LU) using specific measurement methods, the devices are stressed in order to determine its performance in terms of electrical sensitivity.

Electrostatic Discharge (ESD)

Electrostatic discharges are applied to the pins of each sample according to each pin combination. This test is in accordance with the JS-001-2017 / JS-002-2018 standard.

Table 10. ESD Values

Symbol	Parameter	Conditions	Class	Min	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	$T_A = +25\text{ °C}$, conform to JS-001-2017	3A	±4000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)	$T_A = +25\text{ °C}$, conform to JS-002-2018	III	±1000	

Static Latch-up

Tests compliant with EIA / JESD78E IC latch-up standard are required to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin;
- A current injection is applied to each input, output and configurable GPIO pin.

Table 11. Latch-up Values

Symbol	Parameter	Conditions	Level / Class
LU	Static Latch-Up Class	T _A = +105 °C, conform to EIA / JESD78E	II level A (±200 mA)

General Operating Conditions

Table 12. General Operating Conditions

Symbol	Parameter	Conditions	Min.	Max.	Unit
f _{HCLK}	Internal AHB Clock Frequency	LDO voltage	1.3 V	0	150
			1.2 V	0	120
			1.1 V	0	64
f _{PCLK1}	Internal APB1 Clock Frequency	LDO voltage	1.3 V	0	120
			1.2 V, 1.1 V	0	f _{HCLK}
f _{PCLK2}	Internal APB2 Clock Frequency	—	0	f _{HCLK}	MHz
V _{DD}	Digital Operating Voltage	—	2.4	3.6	V
V _{DDA}	Analog Operating Voltage	Must be the same potential as V _{DD}	V _{DD}		V
P _D	Power Dissipation: T _A = 105 °C	100 LQFP – 14 mm × 14 mm	—	264	mW
		64 LQFP – 7 mm × 7 mm	—	216	
		48 LQFP – 7 mm × 7 mm	—	216	
		32 QFN – 4 mm × 4 mm	—	280	
T _A	Ambient Temperature	—	-40	105	°C

Operating Conditions at Power-up / Power-down

Table 13. Operating Conditions at Power-up / Power-down

Symbol	Parameter	Min.	Max.	Unit
t _{VDD}	V _{DD} Rising Time Rate	0	∞(Note)	ms / V
	V _{DD} Falling Time Rate	20	∞	μs / V

Note: When the V_{DD} rising time rate is lower than 1.3 ms / V, it is necessary for code to wait 60 ms until the V_{DD} is higher than 2.57 V before accessing battery powered domain registers.

Embedded Reset and Power Control Block Characteristics

Table 14. Embedded Reset Characteristics

Symbol	Parameter	Min.	Typ.	Max.	Unit
V _{POR}	Power On Reset Threshold	1.81	2.1	2.4	V
V _{LVR}	Low Voltage Reset Threshold	1.68 ⁽²⁾	1.9	2.08	V
V _{LVRhyst}	LVR Hysteresis	—	180	—	mV
T _{RESTEMPO}	Reset Temporization: CPU starts execution after V _{DD} keeps higher than V _{POR} for T _{RESTEMPO}	—	3.5	—	ms

Note: 1. Guaranteed by characterization results, not tested in production.

2. The product behavior is guaranteed by design down to the minimum V_{LVR} value.

Figure 9. Power On Reset and Low Voltage Reset Waveform

Table 15. Programmable Voltage Monitoring Characteristics

V _{PVM5}	PVM Threshold 5 (PVMSEL[2:0] = 101)	Rising edge ^(Note)	2.57	2.68	2.79	V
		Falling edge ^(Note)	2.47	2.58	2.69	V
V _{PVM6}	PVM Threshold 6 (PVMSEL[2:0] = 110)	Rising edge ^(Note)	2.66	2.78	2.9	V
		Falling edge ^(Note)	2.56	2.68	2.8	V
V _{PVM7}	PVM Threshold 7 (PVMSEL[2:0] = 111)	Rising edge	2.76	2.88	3	V
		Falling edge	2.66	2.78	2.9	V
V _{HYS_P} ^(Note)	PVM Hysteresis	—	—	100	—	mV
I _{DD(PVM)} ^(Note)	PVM Current Dissipation	—	—	20	30	μA

Note: Guaranteed by characterization results, not tested in production.

Memory Characteristics

Table 16. Flash Memory Characteristics

Symbol	Parameter	Conditions	Typ. ^(Note)	Max. ^(Note)	Unit
T _{PROG}	Programming Time	—	40	42	μs
t _{SE}	Sector Erase Time (2 KB)	HT32F49163	13.2	16	ms
	Sector Erase Time (1 KB)	HT32F49153	6.6	8	
t _{ME}	Mass Erase Time	—	8.2	10	ms

Note: Guaranteed by design, not tested in production.

Table 17. Flash Memory Endurance and Data Retention^(Note)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
N _{END}	Endurance	T _A = -40 ~ 105 °C	100	—	—	kcycles
t _{RET}	Data Retention	T _A = 105 °C	10	—	—	year

Note: Guaranteed by design, not tested in production.

Supply Current Characteristics

The current consumption, obtained by characterization results and not tested in production, is subjected to several parameters and factors such as the operating voltage, ambient temperature, GPIO pin loading, device software configuration, operating frequencies, GPIO pin switching rate, and executed binary code.

Typical and Maximum Current Consumption

The MCU is placed under the following conditions:

- All GPIO pins are in analog mode.
- Flash memory access time depends on the f_{HCLK} frequency (0 ~ 32 MHz : zero-wait state; 33 ~ 64 MHz: one wait state; 65 ~ 96 MHz: two wait states; 97 ~ 128 MHz: three wait states; 129 MHz and above: four wait states)
- Prefetch ON
- When the peripherals are enabled:
 - If f_{HCLK} > 120 MHz, then f_{PCLK1} = f_{HCLK}/2, f_{PCLK2} = f_{HCLK}, f_{ADCCLK} = f_{PCLK2}/2
 - If f_{HCLK} ≤ 120 MHz, then f_{PCLK1} = f_{HCLK}, f_{PCLK2} = f_{HCLK}, f_{ADCCLK} = f_{PCLK2}/2
- Unless otherwise specified, the typical values are measured with V_{DD} = 3.3 V and T_A = 25 °C conditions, and the maximum values are measured with V_{DD} = 3.6 V.

Table 18. Typical Current Consumption in Run Mode

Symbol	Parameter	Conditions	f _{HCLK}	LDO Voltage (V)	Typ.		Unit
					All Peripherals Enabled	All Peripherals Disabled	
I _{DD}	Supply Current in Run Mode	High Speed External Crystal (HEXT) ⁽¹⁾⁽²⁾	150 MHz	1.3	38.4	16.8	mA
			120 MHz	1.2	33.5	13.2

On-chip Peripheral Current Consumption

The MCU is placed under the following conditions:

- All GPIO pins are in analog mode.
- The given value is calculated by measuring the current consumption difference between “all peripherals clocked OFF” and “only one peripheral clocked ON”.

Table 23. Peripheral Current Consumption

Peripheral		LDO Voltage (V)			Unit
		1.3	1.2	1.1

External Clock Source Characteristics

High-speed External Clock Generated from a Crystal / Ceramic Resonator

The high-speed external (HEXT) clock can be supplied with a 4 to 25 MHz crystal / ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in the table below. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 24. HEXT 4 ~ 25 MHz Crystal Characteristics⁽¹⁾⁽²⁾

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$f_{\text{HEXT_IN}}$	Oscillator Frequency	—	4	8	25	MHz
$t_{\text{SU(HEXT)}}^{(3)}$	Startup Time	V_{DD} is stabilized	—	2	—	ms

Note: 1. Oscillator characteristics are given by the crystal / ceramic resonator manufacturer.

2. Guaranteed by characterization results, not tested in production.

3. $t_{\text{SU(HEXT)}}$ is the startup time measured from the moment HEXT is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

For C_{L1} and C_{L2} , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 33 pF range (typ.), designed for high-frequency applications, and selected to meet the requirements of the crystal or resonator. C_{L1} and C_{L2} are usually the same size. The crystal manufacturer typically specifies a load capacitance that is the series combination of C_{L1} and C_{L2} . PCB and MCU pin capacitance must be taken into account when selecting C_{L1} and C_{L2} . The load capacitance C_L is based on the following formula: $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{\text{stray}}$, where C_{stray} is the pin capacitance and board or PCB-related capacitance. Typically, it is between 2 pF and 7 pF.

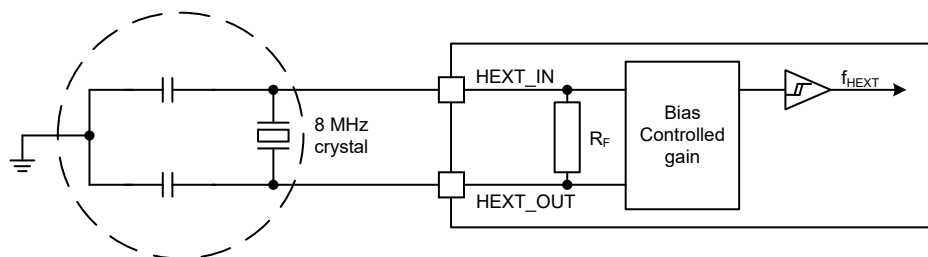

Figure 13. HEXT Typical Application with an 8 MHz Crystal

High-speed External Clock Generated from an External Source

The characteristics given in the table below come from tests performed using a high-speed external clock source.

Table 25. HEXT External Source Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$f_{\text{HEXT_ext}}$	User External Clock Source Frequency ^(Note)	—	1	8	25	MHz
V_{HEXTH}	HEXT_IN Input Pin High Level Voltage		$0.7V_{\text{DD}}$	—	V_{DD}	V
V_{HEXTL}	HEXT_IN Input Pin Low Level Voltage		V_{SS}	—	$0.3V_{\text{DD}}$	
$t_{\text{w(HEXT)}}$ $t_{\text{w(HEXT)}}$	HEXT_IN High or Low Time ^(Note)		5	—	—	ns
$t_{\text{r(HEXT)}}$ $t_{\text{f(HEXT)}}$	HEXT_IN Rising or Falling Time ^(Note)		—	—	20	
$C_{\text{in(HEXT)}}$	HEXT_IN Input Capacitance ^(Note)	—	—	5	—	pF
$\text{Duty}_{\text{(HEXT)}}$	Duty Cycle	—	45	—	55	%
I_{L}	HEXT_IN Input Leakage Current	$V_{\text{SS}} \leq V_{\text{IN}} \leq V_{\text{DD}}$	—	—	± 1	μA

Note: Guaranteed by design, not tested in production.

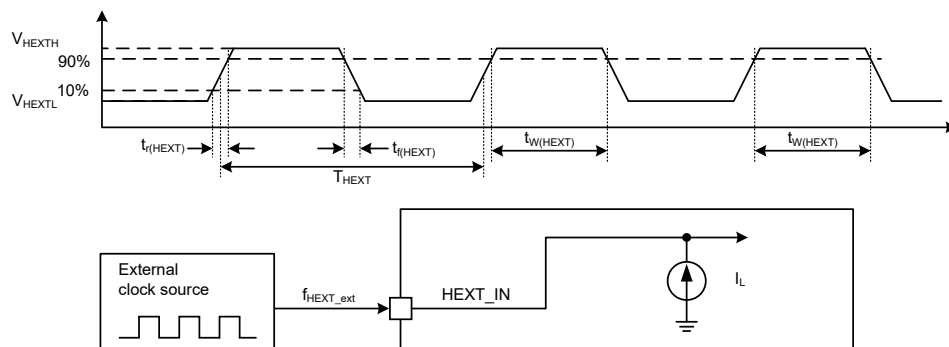

Figure 14. High-speed External Source AC Timing Diagram

Low-speed External Clock Generated from a Crystal / Ceramic Resonator

The low-speed external (LEXT) clock can be supplied with a 32.768 kHz crystal / ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in the table below. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 26. LEXT 32.768 kHz Crystal Characteristics⁽¹⁾⁽²⁾

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$t_{\text{SU(LEXT)}}$	Startup Time	V_{DD} is stabilized	—	200	—	ms

Note: 1. Oscillator characteristics given by the crystal / ceramic resonator manufacturer.

2. Guaranteed by characterization results, not tested in production.

For C_{L1} and C_{L2} , it is recommended to use high-quality ceramic capacitors in the 5 pF to 20 pF range and select to meet the requirements of the crystal or resonator. C_{L1} and C_{L2} , are usually the same size. The crystal manufacturer typically specifies a load capacitance that is the series combination of C_{L1} and C_{L2} .

Load capacitance C_L is based on the following formula: $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{\text{stray}}$ where C_{stray} is the pin capacitance and board or PCB-related capacitance. Typically, it is between 2 pF and 7 pF.

Note: No external resistor is required between LEXT_IN and LEXT_OUT and it is also prohibited to add it.

Figure 15. LEXT Typical Application with a 32.768 kHz Crystal

Low-speed External Clock Generated from an External Source

The characteristics given in the table below come from tests performed using a low-speed external clock source.

Table 27. LEXT External Source Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$f_{\text{LEXT_ext}}$	User External Clock Source Frequency ^(Note)	—	—	32.768	1000	kHz
V_{LEXTH}	LEXT_IN Input Pin High Level Voltage	—	$0.7V_{\text{DD}}$	—	V_{DD}	V
V_{LEXTL}	LEXT_IN Input Pin Low Level Voltage	—	V_{SS}	—	$0.3V_{\text{DD}}$	
$t_{\text{w(LEXT)}}$ $t_{\text{w(LEXT)}}$	LEXT_IN High or Low Time ^(Note)	—	450	—	—	ns
$t_{\text{r(LEXT)}}$ $t_{\text{f(LEXT)}}$	LEXT_IN Rising or Falling Time ^(Note)	—	—	—	50	
$C_{\text{in(LEXT)}}$	LEXT_IN Input Capacitance ^(Note)	—	—	5	—	pF
Duty _(LEXT)	Duty Cycle	—	30	—	70	%
I_{L}	LEXT_IN Input Leakage Current	$V_{\text{SS}} \leq V_{\text{IN}} \leq V_{\text{DD}}$	—	—	± 1	μA

Note: Guaranteed by design, not tested in production.

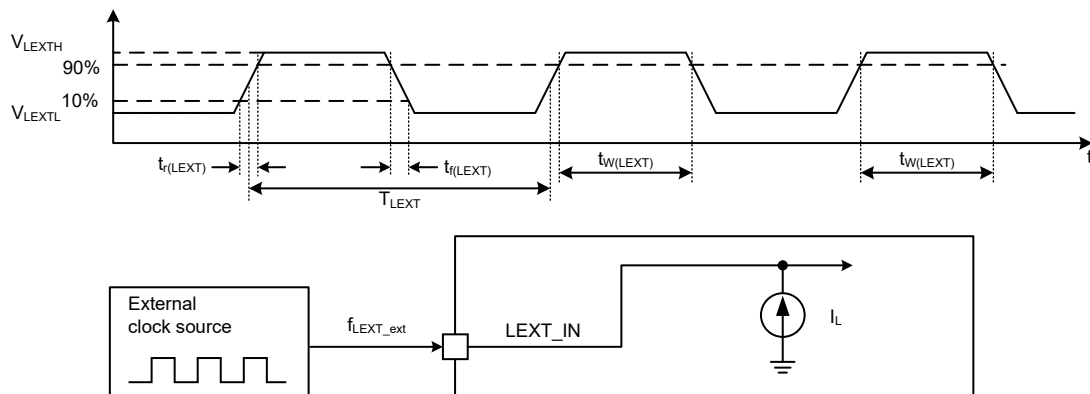

Figure 16. Low-speed External Source AC Timing Diagram

Internal Clock Source Characteristics

High-speed Internal Clock (HICK)

Table 28. HICK Clock Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
f_{HICK}	Frequency	—	—	48	—	MHz
$DuCy_{(HICK)}$	Duty Cycle	—	45	—	55	%
ACC_{HICK}	HICK Clock Accuracy	User-trimmed with the CRM_CTRL register ⁽¹⁾	-1	—	1	%
		ACC-trimmed ⁽¹⁾	-0.25	—	0.25	
		Factory-calibrated ⁽²⁾	$T_A = -40 \sim 105\text{ }^{\circ}\text{C}$	-2.5	—	2.5
			$T_A = -40 \sim 85\text{ }^{\circ}\text{C}$	-2	—	2
			$T_A = 0 \sim 70\text{ }^{\circ}\text{C}$	-1.5	—	1.5
			$T_A = 25\text{ }^{\circ}\text{C}$	-1	0.5	1
$t_{SU(HICK)}^{(2)}$	HICK Clock Startup Time	—	—	—	10.5	μs
$I_{DD(HICK)}^{(2)}$	HICK Clock Power Consumption	—	—	300	330	μA

Note: 1. Guaranteed by design, not tested in production.

2. Guaranteed by characterization results, not tested in production.

Figure 17. HICK Clock Frequency Accuracy vs. Temperature

Low-speed Internal Clock (LICK)

Table 29. LICK Clock Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$f_{LICK}^{(Note)}$	Frequency	—	25	35	45	kHz

Note: Guaranteed by characterization results, not tested in production.

PLL Characteristics

Table 30. PLL Characteristics

Symbol	Parameter	Min. ⁽¹⁾	Typ.	Max. ⁽¹⁾	Unit
f_{PLL_IN}	PLL Input Clock ⁽²⁾	2	8	16	MHz
	PLL Input Clock Duty Cycle	40	—	60	%
$f_{PLL_OUT}^{(3)}$	PLL Multiplier Output Clock	32	—	300	MHz
t_{LOCK}	PLL Lock Time	—	—	200	μs
Jitter	Cycle-to-Cycle Jitter	—	—	300	ps

Note: 1. Guaranteed by design, not tested in production.

2. Use the appropriate multiplier factor to ensure that PLL input clock values are compatible with the range defined by f_{PLL_OUT} .
3. PLL/2 (divided by 2) is used as clock source of system clock. Refer to the HT32F49153/HT32F49163 user manual for details.

Wakeup Time from Low-power Mode

The wakeup times given in the table below are measured on a wakeup phase with the HICK. The clock source used to wake up the devices depends on the current operating mode:

- Sleep mode: The clock source is the clock that was configured before entering Sleep mode.
- Deepsleep or Standby mode: The clock source is the HICK.

Table 31. Low-power Mode Wakeup Time

Symbol	Parameter	Conditions	Typ.	Unit
$t_{WUSLEEP}$	Wakeup from Sleep Mode	—	3.7	μs
$t_{WUDEEPSLEEP}$	Wakeup from Deepsleep Mode	LDO in normal mode	450	μs
		LDO in low-power mode	500	
$t_{WUSTDBY}$	Wakeup from Standby Mode	—	800	μs

EMC Characteristics

Susceptibility tests are performed on a sample basis during device characterization.

Functional EMS (Electromagnetic Susceptibility)

- EFT: A burst of Fast Transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a coupling / decoupling network, until a functional error occurs. This test is compliant with the IEC 61000-4-4 standard.

Table 32. EMS Characteristics

Symbol	Parameter	Conditions	Level / Class
V_{EFT}	Fast transient voltage burst limits to be applied through coupling / decoupling network conforming to IEC 61000-4-4 on V_{DD} and V_{SS} pins to induce a functional error. Both V_{DD} and V_{SS} have a 47 μF capacitor on their entries. Each V_{DD} and V_{SS} pair has a 0.1 μF bypass capacitor.	$V_{DD} = 3.3 V$, 100LQFP, $T_A = +25\text{ }^{\circ}C$, $f_{HCLK} = 150\text{ MHz}$, LDO 1.3 V. Conform to IEC 61000-4-4	4A ($\pm 4\text{ kV}$)
		$V_{DD} = 3.3 V$, 100LQFP, $T_A = +25\text{ }^{\circ}C$, $f_{HCLK} = 120\text{ MHz}$, LDO 1.2 V. Conform to IEC 61000-4-4	
		$V_{DD} = 3.3 V$, 100LQFP, $T_A = +25\text{ }^{\circ}C$, $f_{HCLK} = 64\text{ MHz}$, LDO 1.1 V Conform to IEC 61000-4-4	

EMC characterization and optimization are performed at component level with a typical application environment. It should be noted that good EMC performance is highly dependent on the user application and the software in particular. Therefore, it is recommended that the user applies EMC optimization and prequalification tests in relation with the EMC level.

GPIO Port Characteristics

General Input / Output Characteristics

All GPIOs are CMOS and TTL compliant.

Table 33. GPIO Static Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
V _{IL}	GPIO Input Low Level Voltage	—	-0.3	—	0.28 × V _{DD} + 0.1	V
V _{IH}	TC GPIO Input High Level Voltage	—	0.31 × V _{DD} + 0.8	—	V _{DD} + 0.3	V
	FTa GPIO Input High Level Voltage	Analog mode		—	5.5	
	FT and FTf GPIO Input High Level Voltage	—				
	FTa GPIO Input High Level Voltage	Input floating, input pull-up, or input pull-down mode				
V _{hys}	Schmitt Trigger Voltage Hysteresis ⁽¹⁾	—	200	—	—	mV
			5 % V _{DD}	—	—	—
I _{lkg}	Input Leakage Current ⁽²⁾	V _{SS} ≤ V _{IN} ≤ V _{DD} , TC GPIOs	—	—	±1	μA
		V _{SS} ≤ V _{IN} ≤ 5.5 V FT, FTf and FTa GPIOs	—	—	±1	
R _{PU}	Weak Pull-up Equivalent Resistor ⁽³⁾	V _{IN} = V _{SS}	65	80	130	kΩ
R _{PD}	Weak Pull-down Equivalent Resistor ⁽³⁾⁽⁴⁾	V _{IN} = V _{DD}	65	70	130	kΩ
C _{IO}	GPIO Pin Capacitance	—	—	9	—	pF

Note: 1. Hysteresis voltage between Schmitt trigger switching levels. Guaranteed by characterization results, not tested in production.

2. Leakage could be higher than max if negative current is injected on adjacent pins.

3. When the input is higher than $V_{DD} + 0.3\text{ V}$, the internal pull-up and pull-down resistors must be disabled for FT, FTf and FTa pins.

4. The pull-down resistor of BOOT0 exists permanently.

All GPIOs are CMOS and TTL compliant (no software configuration required). Their characteristics take into account the strict CMOS-technology or TTL parameters.

Output Driving Current

In the user application, the number of GPIO pins that can drive current must be controlled to respect the absolute maximum rating defined in the “Absolute Maximum Values → Ratings” section.

- The sum of the currents sourced by all GPIOs on V_{DD} , plus the maximum Run consumption of the MCU sourced on V_{DD} , cannot exceed the absolute maximum rating I_{VDD} (see Table 8).
- The sum of the currents sunk by all GPIOs on V_{SS} , plus the maximum Run consumption of the MCU sunk on V_{SS} , cannot exceed the absolute maximum rating I_{VSS} (see Table 8).

Output Voltage Levels

All GPIOs are CMOS and TTL compliant.

Table 34. Output Voltage Characteristics

Symbol	Parameter	Conditions	Min.	Max.	Unit
Normal Sourcing / Sinking Strength					
V _{OL}	Output Low Level Voltage	CMOS port, I _{IO} = 4 mA 2.7 V ≤ V _{DD} ≤ 3.6 V	—	0.4	V
V _{OH}	Output High Level Voltage		V _{DD} - 0.4	—	
V _{OL}	Output Low Level Voltage	TTL port, I _{IO} = 2 mA 2.7 V ≤ V _{DD} ≤ 3.6 V	—	0.4	V
V _{OH}	Output High Level Voltage		2.4	—	
V _{OL}	Output Low Level Voltage	I _{IO} = 9 mA 2.7 V ≤ V _{DD} ≤ 3.6 V	—	1.3	V
V _{OH}	Output High Level Voltage		V _{DD} - 1.3	—	
V _{OL}	Output Low Level Voltage	I _{IO} = 2 mA 2.4 V ≤ V _{DD} < 2.7 V	—	0.4	V
V _{OH}	Output High Level Voltage		V _{DD} - 0.4	—	
Large Sourcing / Sinking Strength					
V _{OL}	Output Low Level Voltage	CMOS port, I _{IO} = 6 mA 2.7 V ≤ V _{DD} ≤ 3.6 V	—	0.4	V
V _{OH}	Output High Level Voltage		V _{DD} - 0.4	—	
V _{OL}	Output Low Level Voltage	TTL port, I _{IO} = 5 mA 2.7 V ≤ V _{DD} ≤ 3.6 V	—	0.4	V
V _{OH}	Output High Level Voltage		2.4	—	
V _{OL}	Output Low Level Voltage	I _{IO} = 18 mA 2.7 V ≤ V _{DD} ≤ 3.6 V	—	1.3	V
V _{OH}	Output High Level Voltage		V _{DD} - 1.3	—	
V _{OL}	Output Low Level Voltage	I _{IO} = 4 mA 2.4 V ≤ V _{DD} < 2.7 V	—	0.4	V
V _{OH}	Output High Level Voltage		V _{DD} - 0.4	—	
Maximum Sourcing / Sinking Strength					
V _{OL}	Output Low Level Voltage	CMOS port, I _{IO} = 15 mA 2.7 V ≤ V _{DD} ≤ 3.6 V	—	0.4	V
V _{OH}	Output High Level Voltage		V _{DD} - 0.4	—	
V _{OL}	Output Low Level Voltage	TTL port, I _{IO} = 12 mA 2.7 V ≤ V _{DD} ≤ 3.6 V	—	0.4	V
V _{OH}	Output High Level Voltage		2.4	—	
V _{OL}	Output Low Level Voltage	I _{IO} = 12 mA 2.4 V ≤ V _{DD} < 2.7 V	—	0.4	V
V _{OH}	Output High Level Voltage		V _{DD} - 0.4	—	
Ultra High Sinking Strength ⁽²⁾					
V _{OL}	Output Low Level Voltage	I _{IO} = 25 mA, 2.7 V ≤ V _{DD} ≤ 3.6 V	—	0.4	V
V _{OL}	Output High Level Voltage	I _{IO} = 18 mA, 2.4 V ≤ V _{DD} < 2.7 V			

Note: 1. Guaranteed by characterization results, not tested in production.

2. When GPIO ultra high sinking strength is enabled, its V_{OH} is the same as that of maximum sourcing strength.

Input AC Characteristics

The definition and values of input AC characteristics are given as follows.

Table 35. Input AC Characteristics

Symbol	Parameter	Min	Max	Unit
$t_{EXINTpw}$	Pulse Width of External Signals Detected by EXINT Controller	10	—	ns

NRST Pin Characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor, R_{PU} (see the table below).

Table 36. NRST Pin Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{IL(NRST)}^{(1)}$	NRST Input Low Level Voltage	—	-0.3	—	0.8	V
$V_{IH(NRST)}^{(1)}$	NRST Input High Level Voltage	—	2	—	$V_{DD} + 0.3$	
$V_{hys(NRST)}^{(1)}$	NRST Schmitt Trigger Voltage Hysteresis	—	—	500	—	mV
$R_{PU}^{(2)}$	Weak Pull-up Equivalent Resistor	$V_{IN} = V_{SS}$	30	40	50	kΩ
$t_{ILV(NRST)}^{(1)}$	NRST Input Low Level Invalid Time	—	—	—	40	μs
$t_{ILNV(NRST)}^{(1)}$	NRST Input Low Level Valid Time	—	80	—	—	μs

Note: 1. Guaranteed by design, not tested in production.

2. Guaranteed by characterization results, not tested in production.

Note: 1. The reset network protects the devices against parasitic resets.

2. The user must ensure that the level on the NRST pin can go below the $V_{IL(NRST)}$ max level specified in Table 36. Otherwise, the reset will not be performed by the device.

Figure 18. Recommended NRST Pin Protection

XMC Characteristics

The parameters given in the table below are guaranteed by design and not tested in production.

Asynchronous Waveforms and Timings of SRAM / PSRAM / NOR

The results shown in these tables are obtained with the following XMC configuration:

- AddressSetupTime = 0
- AddressHoldTime = 1
- DataSetupTime = 1

Table 37. Asynchronous Multiplexed PSRAM / NOR Read Timings

Symbol	Parameter	Min.	Max.	Unit
$t_{w(NE)}$	XMC_NE Low Time	$8t_{HCLK} - 2$	$8t_{HCLK} + 2$	ns
$t_{v(NOENOE)}$	XMC_NE Low to XMC_NOE Low	$4t_{HCLK} - 0.5$	$4t_{HCLK} + 1.5$	ns
$t_{w(NOENOE)}$	XMC_NOE Low Time	$4t_{HCLK} - 1$	$4t_{HCLK} + 2$	ns
$t_{h(NE,NOENOE)}$	XMC_NOE High to XMC_NE High Hold Time	-1	—	ns
$t_{v(A,NE)}$	XMC_NE Low to XMC_A Valid	—	7	ns
$t_{v(NADV,NE)}$	XMC_NE Low to XMC_NADV Low	3	5	ns
$t_{w(NADV)}$	XMC_NADV Low Time	$t_{HCLK} - 1.5$	$t_{HCLK} + 1.5$	ns
$t_{h(AD,NADV)}$	XMC_AD (Address) Valid Hold Time after XMC_NADV High	$t_{HCLK} + 3$	—	ns
$t_{h(A,NOENOE)}$	Address Hold Time after XMC_NOE High	$t_{HCLK} + 3$	—	ns
$t_{h(UBLB,NOENOE)}$	XMC_UB / LB Hold Time after XMC_NOE High	0	—	ns
$t_{v(UBLB,NE)}$	XMC_NE Low to XMC_UB / LB Valid	—	0	ns

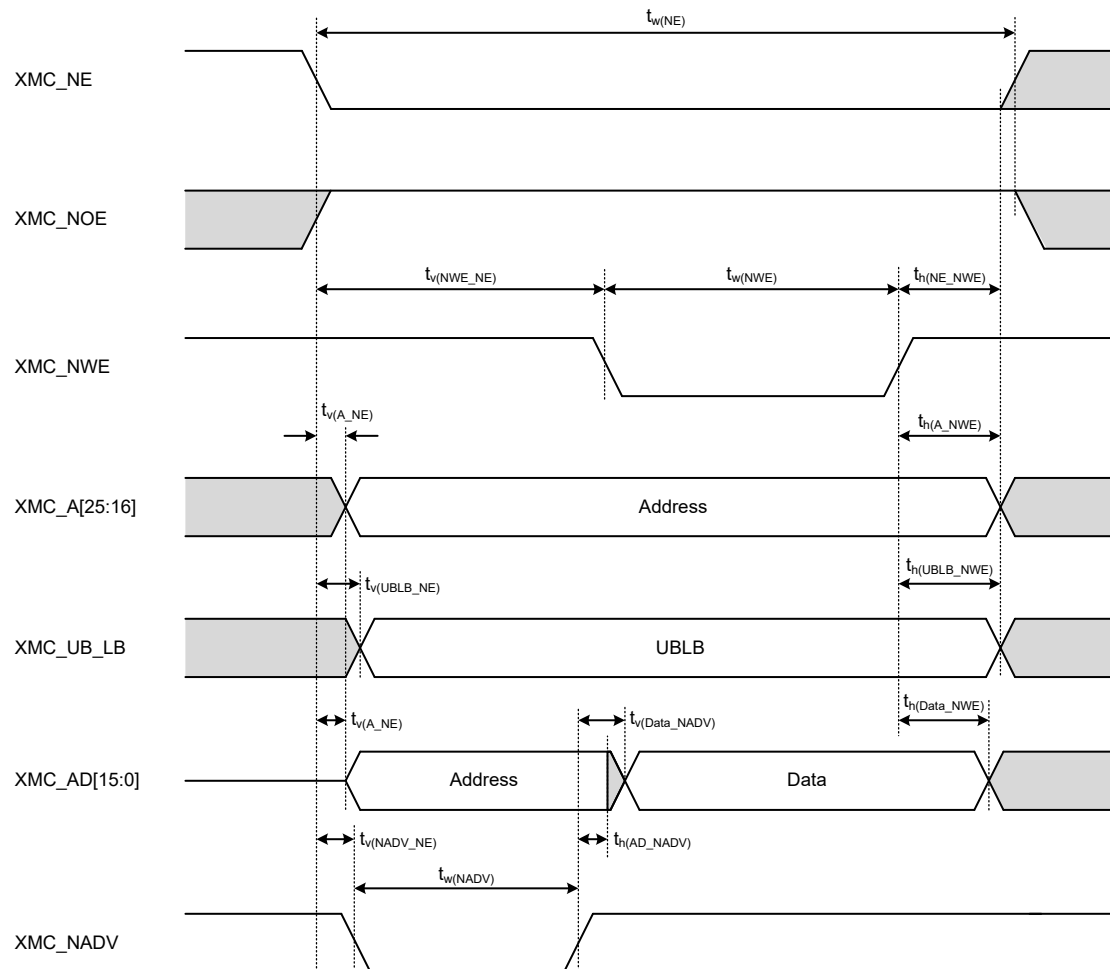

Figure 20. Asynchronous Multiplexed PSRAM / NOR Write Waveforms

Synchronous Waveforms and Timings of PSRAM / NOR

The results given in these tables are obtained with the following XMC configuration:

- BurstAccessMode = XMC_BurstAccessMode_Enable; (Enable burst transfer mode)
- MemoryType = XMC_MemoryType_CRAM; (Memory type is CRAM)
- WriteBurst = XMC_WriteBurst_Enable; (Enable write burst)
- CLKPrescale = 1 (1 memory cycle = 2 HCLK cycles) (Note: CLKPrescale is CLKPSC bit in XMC_BK1TMGx register. Refer to the HT32F49153/HT32F49163 user manual.)
- DataLatency = 1 for NOR Flash; DataLatency = 0 for PSRAM (Note: DataLatency is DTLAT bit in XMC_BK1TMGx register. Refer to the HT32F49153/HT32F49163 user manual.)

TMR Timer Characteristics

The parameters given in the table below are guaranteed by design and not tested in production.

Table 41. TMR Timer Characteristics

Symbol	Parameter	Conditions	Min.	Max.	Unit
$t_{res}(TMR)$	Timer Resolution Time	—	1	—	$t_{TMRxCLK}$
		$f_{TMRxCLK} = 150 \text{ MHz}$	6.66	—	ns
f_{EXT}	Timer External Clock Frequency on CH1 to CH4	—	0	$f_{TMRxCLK}/2$	MHz

SPI Characteristics

Table 42. SPI Characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min.	Max.	Unit
f_{SCK} ($1/t_{c(SCK)}$) ⁽²⁾⁽³⁾	SPI Clock Frequency	Master mode	—	32	MHz
		Slave receive mode	—	32	
		Slave transmit mode	—	25	
$t_{su(CS)}$	CS Setup Time	Slave mode	$2t_{PCLK}$	—	ns
$t_{h(CS)}$	CS Hold Time	Slave mode	$2t_{PCLK}$	—	ns
$t_{w(SCKH)}$ $t_{w(SCKL)}$	SCK High and Low Time	Master mode, prescaler factor = 2	$t_{PCLK} - 3$	$t_{PCLK} + 3$	ns
$Duty_{(SCK)}$	SCK Duty Cycle	Master mode	$f_{PCLK} = f_{HCLK}$	45	%
			$f_{PCLK} = f_{HCLK} / 2$ and prescaler factor $\neq 3$	45	
			$f_{PCLK} = f_{HCLK} / 2$ and prescaler factor = 3	40	
$t_{su(MI)}$	Data Input Setup Time	Master mode	6	—	ns
$t_{su(SI)}$		Slave mode	5	—	
$t_{h(MI)}$	Data Input Hold Time	Master mode	4	—	ns
$t_{h(SI)}$		Slave mode	5	—	
$t_{a(SO)}^{(4)}$	Data Output Access Time	Slave mode	t_{PCLK}	$2t_{PCLK} + 25$	ns
$t_{dis(SO)}^{(5)}$	Data Output Disable Time	Slave mode	t_{PCLK}	$2t_{PCLK} + 25$	ns
$t_{v(SO)}$	Data Output Valid Time	Slave mode (after enable edge)	—	25	ns
$t_{v(MO)}$	Data Output Valid Time	Master mode (after enable edge)	—	10	ns
$t_{h(SO)}$	Data Output Hold Time	Slave mode (after enable edge)	9	—	ns
$t_{h(MO)}$		Master mode (after enable edge)	2	—	

Note: 1. Guaranteed by design, not tested in production.

2. The maximum SPI clock frequency should not exceed $f_{PCLK}/2$.

3. Obtained by characterization results, not tested in production. The maximum SPI clock frequency is highly related with devices and the PCB layout.

4. Min time is the minimum time to drive the output and the max time is for the maximum time to validate the data.

5. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z.

$t_{h(SD_MT)}$	Data Output Hold Time	Master transmitter (after enable edge)	0	—	

Note: Guaranteed by design, not tested in production.

Note: LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 26. I²S Slave Timing Diagram (Philips Protocol)

Note: LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 27. I²S Master Timing Diagram (Philips Protocol)

I²C Characteristics

GPIO pins SDA and SCL have limitation as follows: they are not “true” open-drain. When configured as open-drain, the PMOS connected between the GPIO pin and V_{DD} is disabled, but is still present.

The I²C bus interface can support standard mode (max. 100 kHz), fast mode (max. 400 kHz), and fast mode plus (max. 1 MHz).

OTGFS Characteristics

Table 44. OTGFS Startup Time

Symbol	Parameter	Max.	Unit
t _{STARTUP} (Note)	OTGFS Transceiver Startup Time	1	μs

Note: Guaranteed by design, not tested in production.

Table 45. OTGFS DC Electrical Characteristics⁽¹⁾⁽²⁾

Symbol		Parameter	Conditions	Min.	Typ.	Max.	Unit
Input levels	V _{DD}	OTGFS Operating Voltage	—	3.0 ⁽³⁾	—	3.6	V
	V _{DI}	Differential Input Sensitivity	I (OTGFS_D+/D-)	0.2	—	—	V

Output levels	V _{OL}	Static Output Level Low	1.24 kΩ R _L to 3.6 V ⁽⁴⁾	—	—	0.3	V
	V _{OH}	Static Output Level High	15 kΩ R _L to V _{SS} ⁽⁴⁾	2.8	—	3.6	
R _{PU}		OTGFS_D+ Internal Pull-up Resistor	V _{IN} = V _{SS} during idle	0.97	1.24	1.58	kΩ
			V _{IN} = V _{SS} during reception	1.66	2.26	3.09	
R _{PD}		OTGFS_D+/D- Internal Pull-down Resistor	V _{IN} = V _{DD}	15	19	25	kΩ

Note: 1. All the voltages are measured from the local ground potential.

2. Guaranteed by design, not tested in production.

3. The device USB functionality is ensured down to 2.7 V but not the full USB electrical characteristics that are degraded in the 2.7 to 3.0 V V_{DD} voltage range.

4. R_L is the load connected to the USB drivers.

Figure 28. OTGFS Timings: Definition of Data Signal Rising and Falling Time

Table 46. OTGFS Electrical Characteristics⁽¹⁾

Symbol	Parameter	Conditions	Min. ⁽¹⁾	Max. ⁽¹⁾	Unit
$t_r^{(2)}$	Rising Time	$C_L \leq 50$ pF	4	20	ns
$t_f^{(2)}$	Falling Time	$C_L \leq 50$ pF	4	20	ns
t_{rfm}	Rising / Falling Time Matching	t_r / t_f	90	110	%
V_{CRS}	Output Signal Crossover Voltage	—	1.3	2.0	V

Note: 1. Guaranteed by design, not tested in production.

2. Measured from 10 % to 90 % of the data signal. For more detailed information, please refer to USB Specification Chapter 7 (version 2.0).

12-bit ADC Characteristics

Unless otherwise specified, the parameters given in the table below are preliminary values derived from tests performed under ambient temperature, f_{PCLK2} frequency and V_{DDA} supply voltage conditions summarized in Table 12.

Note: It is recommended to perform a calibration after each power-up.

Table 47. ADC Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
V_{DDA}	Power Supply	—	2.4	—	3.6	V
$V_{REF+}^{(1)}$	Positive Reference Voltage	—	2.0	—	V_{DDA}	V
$I_{DDA}^{(2)}$	Current on the V_{DDA} Input Pin	$f_{ADC} = 80$ MHz	—	1000	1250	μ A
$I_{VREF+}^{(1)(2)}$	Current on the V_{REF+} Input Pin	$f_{ADC} = 80$ MHz	—	470	510	μ A
f_{ADC}	ADC Clock Frequency	$V_{REF+} \geq 3.0$ V	0.6	—	80	MHz
		$V_{REF+} < 3.0$ V	0.6	—	30	
$f_S^{(3)}$	Sampling Rate	12-bit resolution	0.04	—	5.33	MSPS
		Fast channel			4.21	
		Slow channel	0.047	—	6.15	
		10-bit resolution			4.71	
		Fast channel	0.055	—	7.27	
		Slow channel			5.33	
		8-bit resolution	0.067	—	8.88	
		Fast channel			6.15	
$f_{TRIG}^{(3)}$	External Trigger Frequency	$f_{ADC} = 80$ MHz	—	—	4.44	MHz
		—	—	—	18	$1/f_{ADC}$
$V_{AIN}^{(3)}$	Conversion Voltage Range ⁽¹⁾	—	0 (V_{REF-} internally connected to ground)	—	V_{REF+}	V
$R_{AIN}^{(3)}$	External Input Impedance	—	See Table 48			Ω
$C_{ADC}^{(3)}$	Internal Sample and Hold Capacitor	—	—	10	—	pF
$t_{CAL}^{(3)}$	Calibration Time	$f_{ADC} = 80$ MHz	2.56			μ s
		—	205			$1/f_{ADC}$
$t_{lat}^{(3)}$	Preempted Trigger Conversion Latency	$f_{ADC} = 80$ MHz	—	—	37.5	ns
		—	—	—	$3^{(4)}$	$1/f_{ADC}$

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$t_{latr}^{(3)}$	Regular Trigger Conversion Latency	$f_{ADC} = 80 \text{ MHz}$	—	—	25	ns
		—	—	—	$2^{(4)}$	$1/f_{ADC}$
$t_S^{(3)}$	Sampling Time	$f_{ADC} = 80 \text{ MHz}$	0.031	—	8.006	μs
		—	2.5	—	640.5	$1/f_{ADC}$
$t_{STAB}^{(3)}$	Power-up Time	—	45			$1/f_{ADC}$
$t_{CONV}^{(3)}$	Total Conversion Time (including Sampling Time)	$f_{ADC} = 80 \text{ MHz}$ in 12-bit resolution	0.188	—	8.163	μs
		12-bit resolution	15 ~ 653 (t_S for sampling + 12.5 for successive approximation)			$1/f_{ADC}$

Note: 1. V_{REF+} may be connected to V_{DDA} internally, depending on packages.

2. Guaranteed by characterization results, not tested in production.

3. Guaranteed by design, not tested in production.

4. For external triggers, a delay of $1/f_{PCLK2}$ must be added to the latency specified in Table 47.

Table 48 defines the maximum external impedance allowed for an error below 1 of LSB in 12-bit resolution.

Table 48. Max. R_{AIN} when $f_{ADC} = 80 \text{ MHz}$

T_S (Cycle)	t_S (μs)	Max. R_{AIN} (Ω) ^(Note)	
		Fast Channel	Slow Channel
2.5	0.031	30	Not support
6.5	0.081	200	50
12.5	0.156	400	350
24.5	0.306	800	700
47.5	0.594	1700	1500
92.5	1.156	3000	2600
247.5	3.094	9000	8500
640.5	8.006	20000	19000

Note: Guaranteed by design.

Table 49. ADC Accuracy⁽¹⁾⁽²⁾

Symbol	Parameter	Test Conditions	Typ.	Max.	Unit
E_T	Total Unadjusted Error	$f_{ADC} = 80 \text{ MHz}$, $R_{AIN} < 20 \text{ k}\Omega$, $V_{DDA} = 3.0 \sim 3.6 \text{ V}$, $T_A = -40 \sim 105 \text{ }^\circ\text{C}$, $V_{REF+} = V_{DDA}$	± 3	± 5	LSB
E_O	Offset Error		-1	+1/-2	
E_G	Gain Error		+2	+3.5	
E_D	Differential Linearity Error		+2.5	+4/-1	
E_L	Integral Linearity Error		+3	± 4.5	
E_T	Total Unadjusted Error	$f_{ADC} = 30 \text{ MHz}$, $R_{AIN} < 20 \text{ k}\Omega$, $V_{DDA} = 2.4 \sim 3.6 \text{ V}$, $T_A = -40 \sim 105 \text{ }^\circ\text{C}$, $V_{REF+} = V_{DDA}$	± 2	± 3.5	LSB
E_O	Offset Error		-0.5	+1/-2	
E_G	Gain Error		+2	+3	
E_D	Differential Linearity Error		± 0.75	± 1	
E_L	Integral Linearity Error		± 1.5	± 2	

Symbol	Parameter	Test Conditions	Typ.	Max.	Unit
E _T	Total Unadjusted Error	f _{ADC} = 30 MHz, R _{AIN} < 20 kΩ, V _{DDA} = 2.4 ~ 3.6 V, T _A = -40 ~ 105 °C V _{REF+} = 2.0 ~ 2.4 V	±2.5	±4	LSB
E _O	Offset Error		-1.5	+1/-3.5	
E _G	Gain Error		+2	+3.5	
E _D	Differential Linearity Error		±0.7	+1.2/-1	
E _L	Integral Linearity Error		±1.2	±2	

Note: 1. ADC DC accuracy values are measured after internal calibration.
2. Guaranteed by characterization results, not tested in production.

Note: 1. Example of an actual transfer curve.
2. Ideal transfer curve.
3. End point correlation line.
4. E_T = Maximum deviation between the actual and the ideal transfer curves.
E_O = Deviation between the first actual transition and the first ideal one.
E_G = Deviation between the last ideal transition and the last actual one.
E_D = Maximum deviation between actual steps and the ideal one.
E_L = Maximum deviation between any actual transition and the end point correlation line.

Figure 29. ADC Accuracy Characteristics

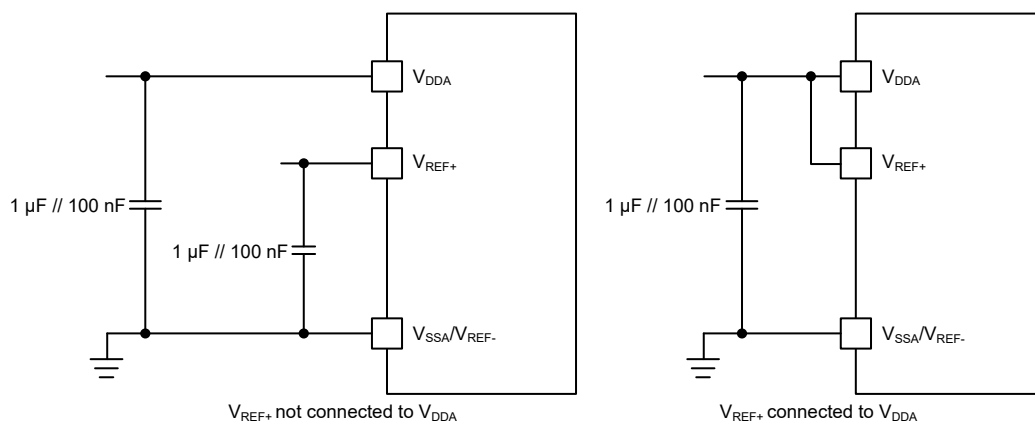

Note: 1. Refer to Table 47 for the values of R_{AIN} and C_{ADC} .

2. $C_{parasitic}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high $C_{parasitic}$ value will downgrade conversion accuracy. To remedy this, f_{ADC} should be reduced.

Figure 30. Typical Connection Diagram Using the ADC

General PCB Design Guidelines

Power supply decoupling should be performed as shown in Figure 31 or Figure 32, depending on whether V_{REF+} is connected to V_{DDA} or not. The 100 nF capacitors should be ceramic (good quality). They should be placed as close as possible to the chip.

Note: V_{REF+} input is available only on 100-pin package.

Figure 31. Power Supply and Reference Decoupling (for Packages with External V_{REF+} Pin)

Note: V_{REF+} input is available only on 100-pin package.

Figure 32. Power Supply and Reference Decoupling (for Packages without V_{REF+} Pin)

Internal Reference Voltage (V_{INTRV}) Characteristics

Table 50. Internal Reference Voltage Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{INTRV}^{(1)}$	Internal Reference Voltage	—	1.16	1.20	1.24	V
$T_{Coeff}^{(1)}$	Temperature Coefficient	—	—	50	100	ppm/°C
$T_{S_VINTRV}^{(2)}$	ADC Sampling Time when Reading the Internal Reference Voltage	—	5	—	—	μs

Note: 1. Guaranteed by characterization results, not tested in production.

2. Guaranteed by design, not tested in production.

Temperature Sensor (V_{TS}) Characteristics

Table 51. Temperature Sensor Characteristics

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$T_L^{(1)}$	V_{TS} Linearity with Temperature	$T_A = -20 \sim +85\text{ °C}$	—	± 1	± 2	°C
		$T_A = -40 \sim +105\text{ °C}$	—	—	± 3	
$Avg_Slope^{(1)(2)}$	Average Slope	—	-4.06	-4.26	-4.47	mV/°C
$V_{25}^{(1)(2)}$	Voltage at 25 °C	—	1.20	1.29	1.38	V
$t_{START}^{(3)}$	Startup Time	—	—	—	100	μs
$T_{S_temp}^{(3)}$	ADC Sampling Time when Reading the Temperature	—	5	—	—	μs

Note: 1. Guaranteed by characterization results, not tested in production.

2. The temperature sensor output voltage changes linearly with temperature. The offset of this line varies from chip to chip due to process variation (up to 50 °C from one chip to another). The internal temperature sensor is more suited to applications that detect temperature variations instead of absolute temperatures. If accurate temperature readings are needed, an external temperature sensor part should be used.

3. Guaranteed by design, not tested in production.

Obtain the temperature using the following formula:

$$\text{Temperature (in } ^\circ\text{C)} = \{(V_{25} - V_{TS}) / \text{Avg_Slope}\} + 25.$$

Where, $V_{25} = V_{TS}$ value for $25\text{ }^\circ\text{C}$ and Avg_Slope = Average Slope for curve between Temperature vs. V_{TS} (given in $\text{mV} / ^\circ\text{C}$).

Figure 33. V_{TS} vs. Temperature

12-bit DAC Specifications

Table 52. DAC Characteristics

Symbol	Parameter	Comments	Min.	Typ.	Max.	Unit
V_{DDA}	Analog Supply Voltage	—	2.4	—	3.6	V
$V_{REF+}^{(1)}$	Reference Supply Voltage	—	2.0	—	3.6	V
V_{SSA}	Ground	—	0	—	0	V

α	0°	—	7°

Thermal Characteristics

Thermal characteristics are calculated based on two-layer board that uses FR-4 material in 1.6 mm thickness. They are guaranteed by design, not tested in production.

Table 53. Package Thermal Characteristics

Symbol	Parameter	Value	Unit
Θ_{JA}	Thermal resistance junction-ambient (100LQFP– 14 mm × 14 mm)	75.6	°C/W
	Thermal resistance junction-ambient (64LQFP – 7 mm × 7 mm)	92.4	
	Thermal resistance junction-ambient (48LQFP – 7 mm × 7 mm)	92.4	
	Thermal resistance junction-ambient (32QFN – 4 mm × 4 mm)	71.3
